ML LAB ASSIGNMENT 5 BC61

Classify the email using the binary classification method. Email Spam detection has two states: a) Normal State - Not Spam, b) Abnormal State - Spam. Use K-Nearest Neighbors and Support Vector Machine for classification. Analyze their performance. Dataset link: The emails.csv

     Confusion matrix [[867 230]
      [ 28 427]]
# cost C = 1 for SVC model
model = SVC(C = 1)
# fit
model.fit(X_train, y_train)
# predict
y_pred = model.predict(X_test)
metrics.confusion_matrix(y_true=y_test, y_pred=y_pred)
     array([[1091, 6], [ 90, 365]])
# score for SVC model
print("SVM accuracy = ",metrics.accuracy_score(y_test,y_pred))
     SVM accuracy = 0.9381443298969072
```

SVM's accuracy is greater than that of KNN's accuracy, with different combinations of cost value and neighbours values, the result might be different.

SVM outperforms KNN as SVM models are able to handle high-dimensional data, learn non-linear relationships, and are less prone to overfitting.
